

Charis - Version 7 Changes

New major release

Charis version 7 is a major release with many new additions, enhancements, and improvements. This is a summary of the most notable changes and what you need to know if you have been using earlier versions.

Please read this carefully to understand the major changes. For further details on these changes, particularly regarding individual characters, see [Version history](#).

Family names and structure

Font family names have changed

Since the changes to both line metrics and spacing are so extensive we have changed the names of the fonts for version 7.

- *Charis SIL* is now *Charis*

This enables you to keep the old v6.2 fonts installed when you install the new v7 ones. Projects and documents can then be gradually changed to use the new v7. **We do recommend that you start using v7 right away and phase out your use of v6.2 as soon as possible.**

Revised family groups with additional weights

Charis now has additional intermediate weights. Previously existing weights have not changed. The CSS values for the weights within each family are in parentheses. Italic faces follow a similar structure and correspondence.

Charis Regular (400)

Charis SIL Regular v6.2

Charis Medium (500)

Charis SemiBold (600)

Charis Bold (700)

Charis SIL Bold v6.2

Charis Italic (400)

Charis SIL Italic v6.2

Charis Medium Italic (500)

Charis SemiBold Italic (600)

Charis Bold Italic (700)

Charis SIL Bold Italic v6.2

The new intermediate weights in this extended, axis-based family can be confusing for applications that still assume families should have only four members (Regular, Italic, Bold, Bold Italic). This is the case for Microsoft Word and some older Windows applications. For details on how to use the intermediate weights in these applications, see [Using Axis-Based Font Families](#).

Decreased default line spacing - and no Compact versions

The default line spacing of Charis has been significantly decreased. In the past, line spacing had to be extreme to avoid clipping of tall letters and high diacritics on Windows. This is no longer a problem, so we've been able to reduce the default line spacing to be more similar to other common text fonts. **We continue to recommend that you set line spacing explicitly in your document styles and preferences, and adjust it as needed for your particular situation.**

The v7 fonts do not have *Compact* variants. The new default line spacing is closer to the previous version's *Compact* line spacing. If you still need even closer line spacing, and your application does not allow explicit

control over line spacing, you can continue to use the [v6.2 Charis SIL Compact fonts](#), which remain available. **If you need any of the new v7 features or characters, but also need them supported in a compact version please [contact us](#).**

TypeTuner Web no longer offers line spacing alternatives for the v7 fonts (Normal, Tight, Loose). If you need Tight or Loose variants the v6.2 fonts remain available and support line spacing alternatives.

Special-purpose modified variants have not been updated to v7

In previous versions, special-purpose modified font variants were available that had been 'pre-tuned' to turn on certain features by default for some regional and *Literacy* uses. These are not available for the v7 fonts, however, the [v6.2 special-purpose fonts are still available](#). **If you need any of the new features or characters in this version, but also need them supported in the special-purpose modified fonts please [contact us](#).**

Note that even in version 7 the literacy forms and other features can be manually preset with TypeTuner Web. The only change to this is that the 'pre-tuned' versions (only) remain at version 6.2.

New features and character support

New kerning

Kerning has now been added to cover the full range of alphabetic symbols except for small caps (which will be included in a future update). To make this practically useful for a wide range of languages the letters have been clustered into overly generalized groups. This enables the kerning to apply to more combinations, but does not allow for careful fine-tuning. The generalized kerning may not be ideal in all cases, and may still require manual adjustment, but it should provide improved spacing compared with previous versions. It is very possible that we have made some mistakes in this massive kerning effort, so please [contact us](#) if you encounter any combinations whose spacing has been made worse than in v6.2.

Warning: Because of the addition of extensive kerning, line, paragraph, and page lengths may be different from v6.2.

Charis SIL v6.200

VoiceToToTöWoWövo ητ d'áb шүдыр [jf]
VoiceToToTöWoWövo ητ d'áb шүдыр [jf]

Charis v7.000

VoiceToToTöWoWövo ητ d'áb шүдыр [jf]
VoiceToToTöWoWövo ητ d'áb шүдыр [jf]

Proportional Oldstyle figures

Charis now includes support for standard OpenType proportional oldstyle figures (`onum`). These only apply to the main numerals, not fractions, superscripts, or numeral-based symbols.

1234567890 1234567890

Capital N Left Hook default changed to lowercase style

The default form for capital N with left hook has been changed to the lowercase style to match the capital Eng. The related feature (`cv44`) has been changed to substitute the uppercase style form. See the [Feature list](#).

Additional character support including Unicode 16

Support has been added for 29 additional characters, some of which were introduced in Unicode 16. For a full list see [Version history](#).

Consistent autohinting

Autohinting has been improved to be more consistent across the whole family.

Charis SIL v6.2 **aaaaaaaaaaaaaaaaaaaa**
Education *shall* be *equally* accessible to all
Charis v7 **aaaaaaaaaaaaaaaaaaaa**
Education *shall* be *equally* accessible to all

Upright and italic faces appear more consistent in height in smaller sizes (Windows 11, Word, 9 pt, 150%, enlarged)

General improvements

Other improvements have been made to over 150 glyphs, OpenType code, and other font aspects, including:

- Letters with upper-right hooks have been redesigned to improve spacing (including kerning) and reduce collisions. Some collisions have been retained to reduce unwanted whitespace within words (e.g. yk).
- Central European carons have improved designs and kerning.
- Bridging diacritics handle many more possible combinations. See [Using Bridging Diacritics](#) for details on how these need to be encoded and ordered.
- Small caps apply to bracketing punctuation.

For more details see [Version history](#).

If you have any difficulty with these changes, or have other suggestions on how we can make the fonts better, please [contact us](#).
